

## MS-360™ Mall Slider— by Oldcastle BuildingEnvelope®

The MS-360™ Mall Slider and Sliding Storefront is the ideal mall slider when economy and ease of operation are primary concerns, making it a good choice for interior applications in schools, offices or malls. The MS-360™ includes aluminum stiles and rails, as well as panels that can be recessed into pockets, and can act as conventional multi-sliding doors or as by-passing wall doors.

### Construction, Configurations and Appearance

#### MS-360™ Mall Slider Construction

The Oldcastle BuildingEnvelope® exclusive flange and neoprene bumper system overlaps from one panel to the next, which prevents racking. These interlocking panels cannot be removed when in the locked position. Panels arranged in more than one plane interlock at the meeting stiles while those meeting in the same plane butt and interlock, forming a safe, secure, tamper resistant barrier. Panels can be manufactured as high as 12'-0" and as wide as 7'-0" and may require an intermediate horizontal depending on the configuration desired.

#### MS-360™ Mall Slider Configurations

Available in three standard styles, the MS-360™ readily adapts to any interior location. When opened, the Conventional Multi-Sliding Door stacks the panels in view. For example, a 4-panel unit will slide to one side allowing access through 3/4 of the original opening. With the By-Passing Wall Door, sliding panels are offset to the interior or exterior of the wall opening allowing full access through the entire original opening. The Pocket Door recesses into a prepared pocket in the wall also permitting full access through the finished opening. All three sliding door types are flush glazed after assembly and are manufactured for 1/4" glazing only.
